Smart Time + Temperature + Cyclic Timer based Re-Circulation Controller

Inaccurate temperature sensing can impact both comfort and efficiency. Unitemp systems employ a "water contacting" stainless steel temperature probe to ensure real-world temperature accuracy and reduce pump operations. With Unitemp installed, you can expect warm water from the hot water tap in just three seconds. With minimal adjustments to your home's hot water circulation system, the temperature will be calibrated to provide the maximum amount of hot water without long waits or the inconvenience of cold and lukewarm water.

This system is designed to operate the recirculation pump only when necessary, conserving both water and energy. The Unitemp demand controller utilizes smart sensing technology to measure temperature and control the pump's operation. In many large hotels, apartment buildings, and villas, Unitemp may run for just half an hour a day or even less, compared to the continuous operation of traditional pumps.

The combination of the Thermo sensor, Cyclic Timer, and Real-Time based Unitemp controller is specifically designed to cycle the circulation during peak demand periods. The Timer activates, supplying power to the temperature control unit.

Features & Benefits:

- Instant hot water to every faucet or shower
- Save up 15,000 gallons of water per year and up to 10% on your water bill
- Easy to install in under one hour
- Maintenance free
- 24-Hour & Weekdays and weekend programmable timer activates system only when you need it
- Pump mounts directly onto hot water return line.
- Can be used with all types of pipe
- Extremely quiet – no vibrations
- Increase Hot Water efficiency.
- Stop the wear and tear on your pump and pipes.
- Cyclic Timer – Prevents operation of circulation pump during non-achieving of set temperature in the hot water storage tank.
- Wi-Fi & Alexa Voice Command feature also available (Optional)
- Auto and Manual mode.
